

## Comments on the Final Exam in MSCF Probability, August 2018

The exam will be on Friday, August 17, from noon to 3:00 PM, in the usual rooms. Please arrive on time. Starting the exam late does **not** entitle you to extra time on the exam. I reserve the right to not allow a student to start the exam after 12:15. You will have to stop at 3:00 regardless of when you start.

You will find on Canvas the exam from last year. **Keep in mind** that last year there were two hours set aside for the exam, and this year we have three hours. Hence, our exam may be a little longer. You may notice some overlap between the exam questions from last year, and homework questions from this year. You should **not** interpret this to mean that you can expect homework questions from this year to appear on this year's exam. I usually do not (intentionally) give you exercises on the exam that you have already done during the course.

I will post a version of last year's exam with answers. Please note that "answers" are not fully worked out "solutions."

You will also find on Canvas the first two pages of the exam. This allows you to see the "rules" and policies. Please read it over before the exam. It is the same as used for the exam last year.

You are allowed one sheet of **handwritten** notes. This means **both sides** of one 8.5" by 11" sheet of paper. It is fine to collaborate with other students in preparing a note sheet. It is also fine to photocopy a handwritten note sheet. It is fine, as long as someone wrote it by hand.

The exam will include the table of distribution facts, and the "Useful Math Facts" sheet.

Other than the notes listed above, you will not have any access to notes, books, or computational tools, including a calculator. You can leave your answers in the forms specified in the instructions; a calculator is not needed.

Finally, remember that the goal is to ensure that you understand the fundamental concepts of probability necessary for the MSCF program. You should view the process of preparing for this exam as your best opportunity to get some practice with probability. We will have two problem sessions on Tuesday and Wednesday, August 14 and 15, during the scheduled lecture time. Some of the exercises during these sessions will be taken directly from past exams, and some of the exercises are more like the homeworks. But, all of the exercises will help you to solidify your understanding of probability.

I will post additional information if I find it necessary.
